ASERS
Publishing

Theoretical and Practical Research in Economic Fields

ASERS Publishing is an advanced e-publisher struggling to bring further worldwide learning, knowledge and research. This transformative mission is realized through our commitment to innovation and enterprise, placing us at the cutting-edge of electronic delivery in a world that increasingly considers the dominance of digital content and networked access not only to books and journals but to a whole range of other pedagogic services.

In both books and journals, ASERS Publishing is a hallmark of the finest scholarly publishing and cutting-edge research, maintained by our commitment to rigorous peer-review process.

Using pioneer developing technologies, ASERS Publishing keeps pace with the rapid changes in the e-publishing market.

ASERS Publishing is committed to providing customers with the information they want, when they want and how they want it. To serve this purpose, ASERS publishing offers digital Higher Education materials from its journals, courses and scientific books, in a proven way in order to engage the academic society from the entire world.

Theoretical and Practical Research in Economic Fields

Many economists today are concerned by the proliferation of journals and the concomitant labyrinth of research to be conquered in order to reach the specific information they require. To combat this tendency, **Theoretical and Practical Research in Economic Fields** has been conceived and designed outside the realm of the traditional economics journal. It consists of concise communications that provide a means of rapid and efficient dissemination of new results, models and methods in all fields of economic research.

Theoretical and Practical Research in Economic Fields publishes original articles in all branches of economics – theoretical and empirical, abstract and applied, providing wide-ranging coverage across the subject area.

Journal promotes research that aim at the unification of the theoretical-quantitative and the empirical-quantitative approach to economic problems and that are penetrated by constructive and rigorous thinking. It explores a unique range of topics from the frontier of theoretical developments in many new and important areas, to research on current and applied economic problems, to methodologically innovative, theoretical and applied studies in economics. The interaction between empirical work and economic policy is an important feature of the journal.

Theoretical and Practical Research in Economic Fields, starting with its first issue, it is indexed in EconLit, RePEC, EBSCO, ProQuest, Cabell Directories and CEEOL databases.

The primary aim of the Journal has been and remains the provision of a forum for the dissemination of a variety of international issues, empirical research and other matters of interest to researchers and practitioners in a diversity of subject areas linked to the broad theme of economic sciences.

All the papers will be first considered by the Editors for general relevance, originality and significance. If accepted for review, papers will then be subject to double blind peer review.

Invited manuscripts will be due till May 10th, 2019, and shall go through the usual, albeit somewhat expedited, refereeing process.

Deadline for submission of proposals: 10th May 2018

Expected publication date: June 2018

Abstract:

This study purpose is to examine the regime shift of public sector and private sector investments on economic growth in North Cyprus using with the Markov Switching Regression technique for the period from the first quarter of the year 1982 to the last quarter of the year of 2015. Both sector investments having effects on the economic growth at the concerned period and method provide the necessary evidence for the regime shifts. Two-regime (growth path/recession path) model has been estimated to analyse the Markov-switching model, Markov transition probabilities and constant expected durations.

Keywords: Public Sector; Private Sector; Economic Growth; Crises; Markov Switching

JEL Classification: C1; H3.

Introduction

The most important factor that affecting the economic growth in a country, without any hesitation is the financial investments. Although, with the existing study such as Tursoy and Faisal (2017), the connection of savings and investments are investigated in North Cyprus and found that there is important connection within two components. Unfortunately, both public and private sectors' investments effects on the growth of the economy were not adequately investigated with literature for North Cyprus. This is creating the motivation for this study to investigate the joint effects of both sectors on economic growth progress. The North Cyprus economy representing the characteristics of small island economy and public sector had been the most important sector during the many years. North Cyprus had been negotiated with Turkey for many years to develop their economy with the economic programs. For an instant, lately to provide a better environment to eliminate the effects of the global turmoil which is started after the year 2017 in North Cyprus, economic programs employed to targeting the fiscal discipline into the Public Sector. These programs were the "efficiency of the Public sector and the improvements in the private sector's competition power" (2010-2012), and "to passing through the sustainable economy" (2013-2015). These economic programs aimed were to loosening the share of the public sector into the economy, to disciplining the public sector' expenditures, to review the tax income that is not limiting the developments of the real or private sector, and others to supporting the improvements to create an environment for having a more competitive and real/private sector dominated sustainable economy in North Cyprus. These improvements into the economy showed better results for North Cyprus; for example, the domestic income was cover to the 96,5% of the domestic expenditure at the year

2016. Before the economic programs just only the 72% of the domestic spending was comprised of the income (2009).

Before, in the literature there some important studies¹ to investigate both sectors' investment with the connection to economic growth. Recently, Ntembe *et al.* (2017) analysed the public investment effects on economic growth in Cameroon. The estimated model to provides evidence for the cointegration between real GDP, and public and private investments as well as labour force. Also, there are studies to investigate the economic relationship with regime switching, for instant, Fong and See (2002) examined the temporal behaviour of the volatility of daily returns on crude oil futures using a generalized regime switching model. They found that regime shifts are clearly present in the data and which in the highly volatile state, a finding which is consistent with previous empirical research on the theory of storage from Fama and French (1988).

There is study previously examined the economic growth expansions and recession paths for modelling and forecasting of economic growth for North Cyprus. Türsoy (2013) used ARMA modelling to formulate the models for finding the suitable model to forecast the growth rate for the economy of North Cyprus. North Cyprus' economy is showing high peaks and troughs in growth rate related to the crises happened in the four decades. All these crises happened at the 1980s, 1990s, 2000s and lately global crises, and these crises affected the North Cyprus' economy worse. Therefore, this study aim is to investigate the growth and crises periods for the North Cyprus' economy with the regime shift approach.

1. Methodology

1.1. Data

This study is covering quarterly data for the period spam 1982Q1 to 2015Q4. The data was obtained from the State Planning Organization of North Cyprus as a yearly data and with the quadratic match-sum method, the data converted from yearly basis to quarterly basis. Transforming the data from yearly to quarterly² is adjusting and solving the problems related to seasonal variation. The private represents the private investments, and public represents public investments as a share of GDP, and growth rate represented by real growth rate and one-year missing data for the year 2001 was produced by the linear interpolation method.

1.2. Empirical Model

Linear regression models are the primary method to investigate the economic relation in econometric analysis. However, some events need to be investigated with nonlinear modelling in econometrics like the macroeconomic relationships that related to regime shifts. Switching regression models which are linear regression models with nonlinearities araised from a discrete change in regime. Switching models are studied in economics by significant papers such as Goldfeld and Quandt (1973), Maddala (1986), Hamilton (1996), Frühwirth-Schnatter (2004), Sim *et al.* (2008) and Kim *et al.* (2008).

The basic model for the switching regression starts to suppose the random variable of y_t follows the process that depends on the value of an unobserved discrete state variable s_t . Its assumed that there are M possible regimes, and its defined as to be the regime m in period t when $s_t = m$, for $m = 1, \dots, M$. The switching model assumes that there are different models regarding to the each regime shift. With the below equation, given regressors are X_t and Z_t , the conditional mean of y_t in regime m is assumed to be in linear form:

$$\mu_t(m) = X_t'\beta_m + Z_t'\gamma$$

where β_m and γ are k_X and k_Z vectors of coefficients and its noted that, in the above equation, the β_m coefficients for X_t is indexed by regime; the coefficient of γ associate with the Z_t which is the regime invariant.

1.3. Empirical Results

In the empirical results section, the Markov switching regression will be analysed. In the Markov Switching analysis, two regimes (expansion and recession) will be analysed.

Time series analyses usually start with the unit root analyses for the time series. To understand the unique order of the integration for the series, Perron – Vogelsang unit root test with one endogenous structural break has been employed and represented in Table 1.

¹ See for more details to Arrow and Lind (1978), Bryson and Roering (1987) and Holtz-Eakin (1992).

² Also Shahbaz et al. (2015) used the quadratic match-sum method for converting the data into quarterly data.

Table 1. Perron–Vogelsang test with one Endogenous Structural Break

Variables	Perron–Vogelsang test with one Endogenous Structural Break				
	AO -model t-Statistics	TB1	IO-model t-Statistics	TB1	Result
Real Growth	-3.500 (5)	2008Q3	-3.304 (8)	2005Q4	I(0)
LnPRIVATE	-3.165 (8)	2004Q4	-4.108 (9)	2003Q1	I(0)
LnPUBLIC	-3.750** (5)	2010Q1	-3.932 (5)	2008Q3	I(0)
	First Difference				
DReal Growth	-3.842** (1)	1991Q3	-5.590** (7)	1991Q4	I(1)
DLnPRIVATE	-4.956** (7)	1996Q3	-5.894** (7)	1996Q1	I(1)
DLnPUBLIC	-5.783** (4)	1995Q3	-6.086** (4)	1995Q4	I(1)

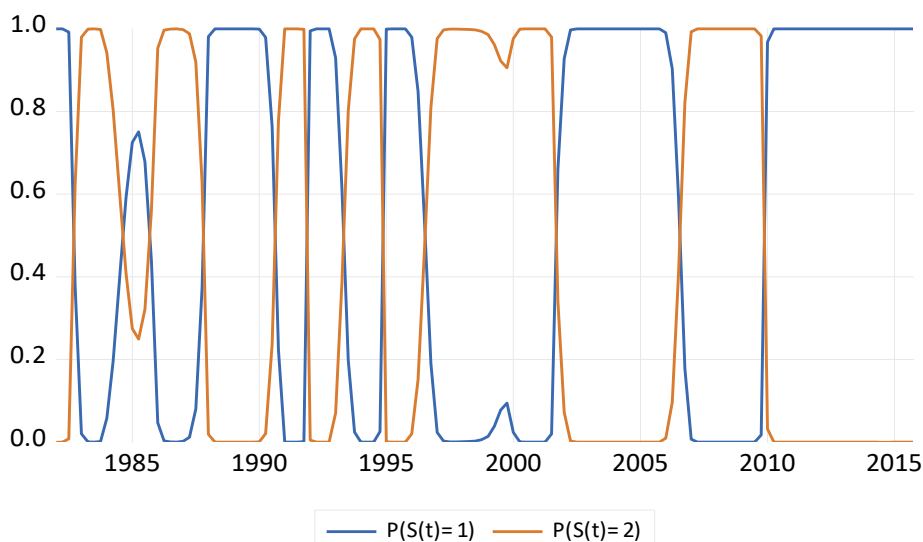

Note: ** represents the significance at 5% level.

As mention above that for finding the order of integration of the series, Perron and Vogelsang (1992) unit root test applied with one structural break. The results from the unit root tests confirmed that all the variables are non-stationary at the level and with the first difference all become to stationary. Also, the break dates are shown in Table 1. After the unique order of integration analyses allow us to proceed to further investigation with the series. To analyses the regime shift in the series, two kinds of period which expansion path and recession path are determined, and Markov Switching Regression analyses is applied to determine the shifts. Figure 1 represents the two possible regime shifts with a graph for representing the two shifting periods. Approximately, the crises/recession paths that were happened in North Cyprus in real time can be observed from the figure 1, that are the crises3 times at 1980s, the beginning of the 1990s and 2000s, and also the global crises which are started at the year 2007 which are related to the Turkey and global crises. Turkey is the closest economy to the North Cyprus and its crises are implicitly affecting also the island economy. Also North Cyprus had a banking crisis at the year 2001.

In the figure 1, the recession path observed with the orange line and the expansion paths are seen with the blue lines. All these findings from Markov Switching regression are matched with the real time of the expansion and recession periods in North Cyprus. All these periods are represented with the below figure.

Figure 1. Regime probabilities for possible regime shifts.

Markov Switching Smoothed Regime Probabilities

In table 2, both public and private investments are significant in regime 1 which is representing the growth time of the economy. With the results, in the economic growth path, public investments are more affecting the economy than the private investment. The coefficient of public sector investment is doubled regarding to the private sector investment. Meanwhile, in the regime 2 which is representing the crises or recession path, both sector having significant effect on the economy. Although not like the expansion path, in

³ For more detail see the study of Gonsel *et al.* (2010).

the recession/crisis time, private sector investments are effects on more to the economic recession. Of course, also public sector investment is significant and having effect also on the crises.

Table 2. Markov Switching Regression Results

Variable	Coefficient	Z-Statistic
Regime 1		
logPublic	4.1343	9.8688***
logPrivate	2.1980	3.6586***
Constant	25.2928	8.7321***
Regime 2		
logPublic	1.9240	9.8689***
logPrivate	2.4619	4.4373***
Constant	18.9030	7.8430***
Log(sigma)(common)	-0.3599	-5.3418***
Transition Matrix Parameters		
P11-C	2.1626	4.1326***
P21-C	-2.4986	-5.4044***

Note: *** represents the significance at 1% level.

Table 3. Transition summary: Constant Markov transition probabilities and expected durations

Constant transition probabilities: $P(i,k) = P(s(t) = k s(t-1) = i)$ (row = i / column = j)		
	1	2
1	0.8968	0.1032
2	0.0759	0.9240
Constant expected durations:		
	1	2
	9.6934	13.1661

Table 3 represent the result from Markov switching model with constant transition probabilities. Note that there is considerable state dependence in the transition probabilities with a relatively higher probability of remaining in the origin regime (0.8968 for the high output state/expansion path, 0.9240 for the low output state/recession path). The duration of the first regime (expansion path) is approximately 9.69 quarter and the second regime (recession path) is approximately 13.17 quarter.

Conclusion

The financial investment into the economy is the most important component for the economic growth. With this study, it can be concluded that both sector (public/private) affecting two possible regimes such as economic growth and crises paths. All the findings are supporting the view that both sectors are having a significant share on the economy of North Cyprus. Although with the economic programs to improve the private sector in North Cyprus's economy, still public sector having more share in economic growth part against to the private sector in the economy. On the other situation that is recession time, private sector promoting more severe situation than the public sector. Finally, based on the finding from the analysis, results showing that growth time is passing approximately slightly more than 2 years and crises time are slightly passing more than three years. Consequently, both investments for the country is the most crucial components and significant coefficients for economic growth. Usually, the purpose of public sector investments is to improve the necessary infrastructure in the country. All these public sector's investments are the necessary investment for the country to improve its conditions for having better prosperity; in the meanwhile, improving the competitiveness of the private sector within the economy is vital to develop the economy further, also. Continuing to the economic programs for North Cyprus is crucial for developing both sectors' efficiencies and competitiveness to having more economic growth in North Cyprus.
