Theoretical and Practical Research in Economic Fields

ASERS Publishing is an advanced e-publisher struggling to bring further worldwide learning, knowledge and research. This transformative mission is realized through our commitment to innovation and enterprise, placing us at the cutting-edge of electronic delivery in a world that increasingly considers the dominance of digital content and networked access not only to books and journals but to a whole range of other pedagogic services.

In both books and journals, ASERS Publishing is a hallmark of the finest scholarly publishing and cutting-edge research, maintained by our commitment to rigorous peer-review process.

Using pioneer developing technologies, ASERS Publishing keeps pace with the rapid changes in the e-publishing market.

ASERS Publishing is committed to providing customers with the information they want, when they want and how they want it. To serve this purpose, ASERS publishing offers digital Higher Education materials from its journals, courses and scientific books, in a proven way in order to engage the academic society from the entire world.

Call for Papers

Volume X, Issue 2(20), Winter 2019

Theoretical and Practical Research in Economic Fields

Many economists today are concerned by the proliferation of journals and the concomitant labyrinth of research to be conquered in order to reach the specific information they require. To combat this tendency, **Theoretical and Practical Research in Economic Fields** has been conceived and designed outside the realm of the traditional economics journal. It consists of concise communications that provide a means of rapid and efficient dissemination of new results, models and methods in all fields of economic research.

Theoretical and Practical Research in Economic Fields publishes original articles in all branches of economics – theoretical and empirical, abstract and applied, providing wide-ranging coverage across the subject area.

Journal promotes research that aim at the unification of the theoretical-quantitative and the empirical-quantitative approach to economic problems and that are penetrated by constructive and rigorous thinking. It explores a unique range of topics from the frontier of theoretical developments in many new and important areas, to research on current and applied economic problems, to methodologically innovative, theoretical and applied studies in economics. The interaction between empirical work and economic policy is an important feature of the journal.

Theoretical and Practical Research in Economic Fields, starting with its first issue, it is indexed in EconLit, RePEC, EBSCO, ProQuest, Cabell Directories and CEEOL databases.

The primary aim of the Journal has been and remains the provision of a forum for the dissemination of a variety of international issues, empirical research and other matters of interest to researchers and practitioners in a diversity of subject areas linked to the broad theme of economic sciences.

All the papers will be first considered by the Editors for general relevance, originality and significance. If accepted for review, papers will then be subject to double blind peer review.

Invited manuscripts will be due till November 10th, 2019, and shall go through the usual, albeit somewhat expedited, refereeing process.

Deadline for submission of proposals: 10th November 2019

Expected publication date: December 2019

Abstract:

This research uses annual time series data on Consumer Price Index (CPI) in Canada from 1960 to 2017, to model and forecast CPI using the Box – Jenkins ARIMA technique. Diagnostic tests indicate that the C series is I (1). The study presents the ARIMA (1, 1, 1) model for predicting CPI in Canada. The diagnostic tests further show that the presented parsimonious model is stable. The results of the study apparently show that CPI in Canada is likely to continue on a sharp upwards trajectory in the next decade. The study encourages policy makers to make use of tight monetary and fiscal policy measures in order to control inflation in Canada.

Keywords: forecasting, inflation.

JEL Classification: C53; E31; E37; E47.

Introduction

Inflation is one of the central terms in macroeconomics (Enke and Mehdiyev 2014) as it harms the stability of the acquisition power of the national currency, affects economic growth because investment projects become riskier, distorts consuming and saving decisions, causes unequal income distribution and also results in difficulties in financial intervention (Hurtado *et al.* 2013). Consumer Price Index (CPI) may be regarded as a summary statistic for frequency distribution of relative prices (Kharimah *et al.* 2015). CPI number measures changes in the general level of prices of a group of commodities. It thus measures changes in the purchasing power of money (Monga 1977, Subhani and Panjwani 2009). As it is a prominent reflector of inflationary trends in the economy, it is often treated as a litmus test of the effectiveness of economic policies of the government of the day (Sarangi *et al.* 2018). Precisely forecasting the change of CPI is significant to many aspects of economics, some examples include fiscal policy, financial markets and productivity. Also, building a stable and accurate model to forecast the CPI will have great significance for the public, policy makers and research scholars (Du *et al.* 2014). In this study we use CPI as an indicator of inflation in Canada and then attempt to model and forecast CPI in Canada using the Box-Jenkins ARIMA technique.

1. Literature Review

Zivko and Bosnjak (2017) studied inflation in Croatia using ARIMA models with a data set ranging over the period January 1997 to November 2015 and established that the ARIMA (0, 1, 1) x (0, 1, 1)₁₂ is the optimal model for forecasting inflation in Croatia. In Albania, Dharmo *et al.* studied CPI using SARIMA models with a data set

ranging over the period January 1994 to December 2007 and discovered that SARIMA models are satisfactory for a short-term prediction compared to the multiple regression model forecast. Nyoni (2018) studied inflation in Zimbabwe using GARCH models with a data set ranging over the period July 2009 to July 2018 and established that there is evidence of volatility persistence for Zimbabwe’s monthly inflation data. In another study, Nyoni (2018) modeled inflation in Kenya using ARIMA and GARCH models and relied on annual time series data over the period 1960 – 2017 and found out that the ARIMA (2, 2, 1) model, the ARIMA (1, 2, 0) model and the AR (1) – GARCH (1, 1) model are good models that can be used to forecast inflation in Kenya. Nyoni and Nathaniel (2019), based on ARMA, ARIMA and GARCH models; studied inflation in Nigeria using time series data on inflation rates from 1960 to 2016 and found out that the ARMA (1, 0, 2) model is the best model for forecasting inflation rates in Nigeria.

2. Materials and Methods

2.1. Box – Jenkins ARIMA Models

One of the methods that are commonly used for forecasting time series data is the Autoregressive Integrated Moving Average (ARIMA) (Box and Jenkins 1976, Brocwell and Davis 2002, Chatfield 2004, Wei 2006, Cryer and Chan 2008). For the purpose of forecasting Consumer Price Index (CPI) in Canada, ARIMA models were specified and estimated. If the sequence $\Delta^d C_t$ satisfies an ARMA (p, q) process; then the sequence of C_t also satisfies the ARIMA (p, d, q) process such that:

$$\Delta^d C_t = \sum_{i=1}^p \beta_i \Delta^d C_{t-i} + \sum_{i=1}^q \alpha_i \mu_{t-i} + \mu_t \tag{1}$$

which we can also re – write as:

$$\Delta^d C_t = \sum_{i=1}^p \beta_i \Delta^d L^i C_t + \sum_{i=1}^q \alpha_i L^i \mu_t + \mu_t \tag{2}$$

where: Δ is the difference operator, vector $\beta \in \mathbb{R}^p$ and $\alpha \in \mathbb{R}^q$.

2.2. The Box – Jenkins Methodology

The first step towards model selection is to difference the series in order to achieve stationarity. Once this process is over, the researcher will then examine the correlogram in order to decide on the appropriate orders of the AR and MA components. It is important to highlight the fact that this procedure (of choosing the AR and MA components) is biased towards the use of personal judgement because there are no clear – cut rules on how to decide on the appropriate AR and MA components. Therefore, experience plays a pivotal role in this regard. The next step is the estimation of the tentative model, after which diagnostic testing shall follow. Diagnostic checking is usually done by generating the set of residuals and testing whether they satisfy the characteristics of a white noise process. If not, there would be need for model re – specification and repetition of the same process; this time from the second stage. The process may go on and on until an appropriate model is identified (Nyoni 2018).

2.3. Data Collection

This study is based on a data set of annual CPI (C) in Canada ranging over the period 1960 – 2017. All the data was gathered from the World Bank.

2.4. Diagnostic Tests and Model Evaluation

2.4.1. Stationarity Tests

2.4.1.1. The ADF Test

Table 1. Levels-intercept

Variable	ADF Statistic	Probability	Critical Values		Conclusion
C	0.089399	0.9622	-3.552666	@1%	Non-stationary
			-2.914517	@5%	Non-stationary
			-2.595033	@10%	Non-stationary

Table 2. Levels-trend and intercept

Variable	ADF Statistic	Probability	Critical Values		Conclusion
C	-2.236151	0.4608	-4.130526	@1%	Non-stationary
			-3.492149	@5%	Non-stationary
			-3.174802	@10%	Non-stationary

Table 3. Without intercept and trend and intercept

Variable	ADF Statistic	Probability	Critical Values		Conclusion
C	2.110425	0.9910	-2.606911	@1%	Non-stationary
			-1.946764	@5%	Non-stationary
			-1.613062	@10%	Non-stationary

Tables 1 – 3 indicate that C is non-stationary in levels.

Table 4. 1st Difference-intercept

Variable	ADF Statistic	Probability	Critical Values		Conclusion
C	-3.807637	0.0049	-3.552666	@1%	Stationary
			-2.914517	@5%	Stationary
			-2.595033	@10%	Stationary

Table 5. 1st Difference-trend and intercept

Variable	ADF Statistic	Probability	Critical Values		Conclusion
C	-3.775706	0.0253	-4.130526	@1%	Non-stationary
			-3.492149	@5%	Stationary
			-3.174802	@10%	Stationary

Table 6. 1st Difference-without intercept and trend and intercept

Variable	ADF Statistic	Probability	Critical Values		Conclusion
C	-10.15676	0.0000	-3.555023	@1%	Stationary
			-2.915522	@5%	Stationary
			-2.595565	@10%	Stationary

Tables 4 – 6 indicate that the C series is stationary after taking first differences.

2.5. Evaluation of ARIMA models (with a constant)

Table 7. Model evaluation

Model	AIC	U	ME	MAE	RMSE	MAPE
ARIMA (1, 1, 1)	153.9987	0.48666	0.033196	0.67787	0.87766	1.8374
ARIMA (1, 1, 0)	154.07	0.52295	0.018302	0.67913	0.89392	1.9378
ARIMA (0, 1, 1)	163.8655	0.66239	0.0072621	0.74061	0.96917	2.2244
ARIMA (2, 1, 1)	155.8095	0.48723	0.03899	0.68168	0.87611	1.8464
ARIMA (1, 1, 2)	155.7938	0.48765	0.039006	0.68152	0.87601	1.8478
ARIMA (2, 1, 2)	157.7934	0.48763	0.033909	0.68161	0.876	1.8479

A model with a lower AIC value is better than the one with a higher AIC value (Nyoni 2018). Theil's U must lie between 0 and 1, of which the closer it is to 0, the better the forecast method (Nyoni 2018). The study will consider both the AIC and the U as the criterion for choosing the best model for forecasting CPI in Canada. Therefore, the ARIMA (1, 1, 1) model is eventually selected.

2.6. Residual and Stability Tests

2.6.1. ADF Tests of the Residuals of the ARIMA (1, 1, 1) Model

Table 8. Levels-intercept

Variable	ADF Statistic	Probability	Critical Values		Conclusion
R _t	-7.015789	0.0000	-3.555023	@1%	Stationary
			-2.915522	@5%	Stationary
			-2.595565	@10%	Stationary

Table 9. Levels-trend and intercept

Variable	ADF Statistic	Probability	Critical Values		Conclusion
R _t	-6.943109	0.0000	-4.133838	@1%	Stationary
			-3.493692	@5%	Stationary
			-3.175693	@10%	Stationary

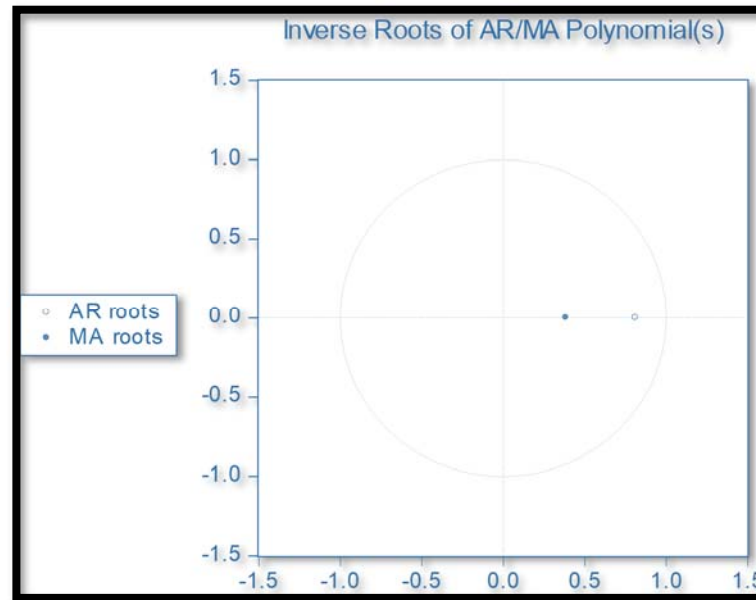

Table 10. Without intercept and trend and intercept

Variable	ADF Statistic	Probability	Critical Values		Conclusion
R _t	-7.080735	0.0000	-2.607686	@1%	Stationary
			-1.946878	@5%	Stationary
			-1.612999	@10%	Stationary

Tables 8, 9 and 10 reveals that the residuals of the ARIMA (1, 1, 1) model are stationary.

2.6.2. Stability Test of the ARIMA (1, 1, 1) Model

Figure 1. Inverse Roots

Since the corresponding inverse roots of the characteristic polynomial lie in the unit circle, it illustrates that the chosen ARIMA (1, 1, 1) model is indeed stable and suitable for predicting CPI in Canada over the period under study.

3. Findings

3.1. Descriptive Statistics

Table 11. Descriptive Statistics

Description	Statistic
Mean	58.862
Median	62.5
Minimum	13
Maximum	112
Standard deviation	33.528
Skewness	-0.032287
Excess kurtosis	-1.4415

As shown above, the mean is positive, i.e. 58.862. The minimum is 13 while the maximum is 112. The skewness is -0.032287 and the most striking characteristic is that it is positive, indicating that the C series is positively skewed and non-symmetric. Excess kurtosis is -1.4415; showing that the C series is not normally distributed.

3.2. Results Presentation

Table 12. Results

ARIMA (1, 1, 1) Model:				
$\Delta C_{t-1} = 1.64731 + 0.816188\Delta C_{t-1} - 0.342036\mu_{t-1}$ (3)				
P:	(0.0000)	(0.0000)	(0.0704)	
S. E:	(0.3709)	(0.1138)	(0.1891)	
Variable	Coefficient	Standard Error	Z	p-value
Constant	1.64731	0.370874	4.442	0.0000***
AR (1)	0.816188	0.11383	7.17	0.0000***
MA (1)	-0.342036	0.189055	-1.809	0.0704*

Author's calculation (Note: *, **, *** refers to 10%, 5% and 1% levels of significance, respectively)

The model constant is positive and statistically significant at 1% level of significance. This points to the fact that CPI in Canada cannot go below 1.65 even if the effect of the MA and AR components were to be ruled out. The coefficient of the AR (1) component is positive and statistically significant at 1% level of significance. This basically points to the fact that previous period CPI indices are important in determining the current and future levels of CPI in Canada. For example, when previous period CPI was relatively high; it arguably causes economic agents to anticipate even higher inflationary pressures in the next period thereby inducing policy ineffectiveness: in the long-run inflation goes up. The results of the study indicate that a 1% increase in the previous period CPI will lead to approximately 0.8% increase in the current period CPI. The coefficient of the MA (1) component is negative and statistically significant at 10% level of significance. This implies that unobserved shocks to CPI have a negative effect on current CPI in Canada. Such shocks include but are not limited to monetary policy shocks and political events. The results actually show that a 1% increase in such shocks will lead to approximately 0.34% decrease in CPI, thus a reduced level of inflation. For example, if a new government or political dispensation is elected into power in Canada; it could lower inflationary expectations and thereby enable policy makers to smoothly engineer disinflation and hence lower CPI levels. The overall striking feature of these results is that the coefficient of the AR (1) component is positive while the coefficient of the MA (1) component is negative as conventionally expected.

3.2.1. Forecast Graph

Figure 2. Forecast graph

3.2.2. Predicted CPI in Canada

Table 13. Predictions

Year	Prediction	Std. Error	95% Confidence Interval
2018	113.73	0.867	112.03 - 115.43
2019	115.45	1.544	112.42 - 118.47
2020	117.15	2.232	112.77 - 121.53
2021	118.84	2.923	113.11 - 124.57
2022	120.53	3.605	113.46 - 127.59
2023	122.21	4.272	113.83 - 130.58
2024	123.88	4.920	114.23 - 133.52
2025	125.54	5.547	114.67 - 136.42
2026	127.21	6.153	115.15 - 139.27
2027	128.87	6.737	115.67 - 142.07

Figure 2 (with a forecast range from 2018 – 2027) and Table 13, clearly show that CPI in Canada is indeed set to continue rising sharply, in the next decade.

4. Policy Implication and Conclusion

After performing the Box-Jenkins approach, the ARIMA was engaged to investigate annual CPI of Canada from 1960 to 2017. The study mostly planned to forecast the annual CPI in Canada for the upcoming period from 2018 to 2027 and the best fitting model was selected based on how well the model captures the stochastic variation in the data. The ARIMA (1, 1, 1) model, as indicated by the AIC statistic; is not only stable but also the most suitable model to forecast the CPI of Canada for the next ten years. In general, CPI in Canada; showed an upwards trend over the forecasted period. Based on the results, policy makers in Canada should engage more proper economic and monetary policies in order to fight such increase in inflation as reflected in the forecasts. Therefore, relevant authorities in Canada ought to rely more on tight monetary policy, which should be complimented by a tight fiscal policy stance.
